605.486 – Android Development

Module 8a
Fragments

Fragments

- Allows mix of UIs in one activity
  - Better utilize screen space (landscape, tablets)
- Can vary based on device characteristics

Fragments

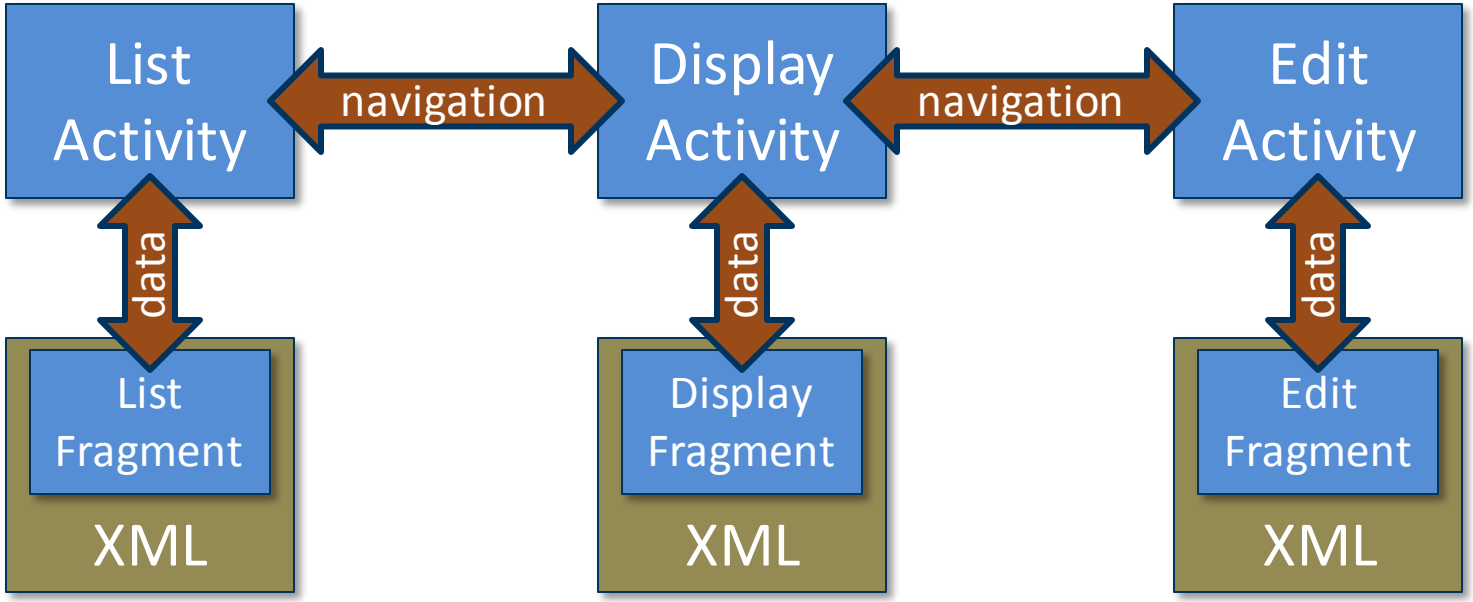
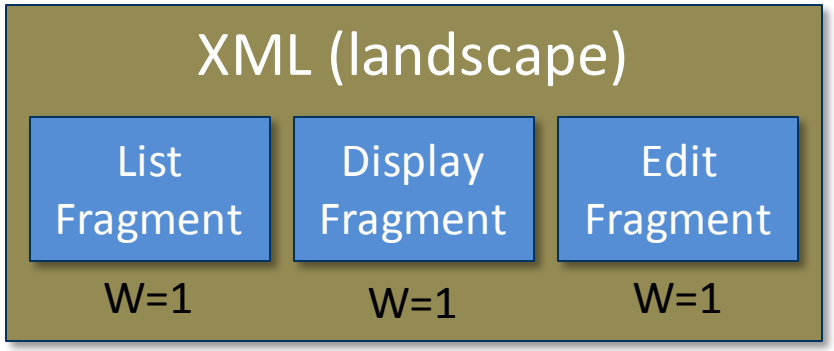
Converting to Fragments





Fragments contain the “smarts”; Activities navigate

Use Fragment Manager to only show Display or Edit fragment

Pull Smarts into Fragments (1)

- GOAL: Tease out all functionality into fragments
- Start with “todo” application from last week

Pull Smarts into Fragments (2)

- Copy XXXActivity -> XXXFragment
- Copy activity_xxx.xml -> fragment_xxx.xml
- Gut XXXActivity classes
  - Remove everything except onCreate()'s super() & setContentView()

Pull Smarts into Fragments (3)

- In new XXXFragment classes
  - Extend android.support.v4.app.Fragment
  - Create onCreateView
    - Move code from onCreate (except super call)
    - Inflate fragment xml (not activity xml) -> view
    - Add "view." in front of findViewById
    - Return view
  - Change onCreateOptionsMenu to add inflater arg
  - Change onCreate – call setHasOptionsMenu(true)!
  - Change "this" to getActivity()
  - Add "getActivity()." in front of setResult(), finish(), getIntent()
- Change activity_xxx.xml to use <fragment>
- Test!
