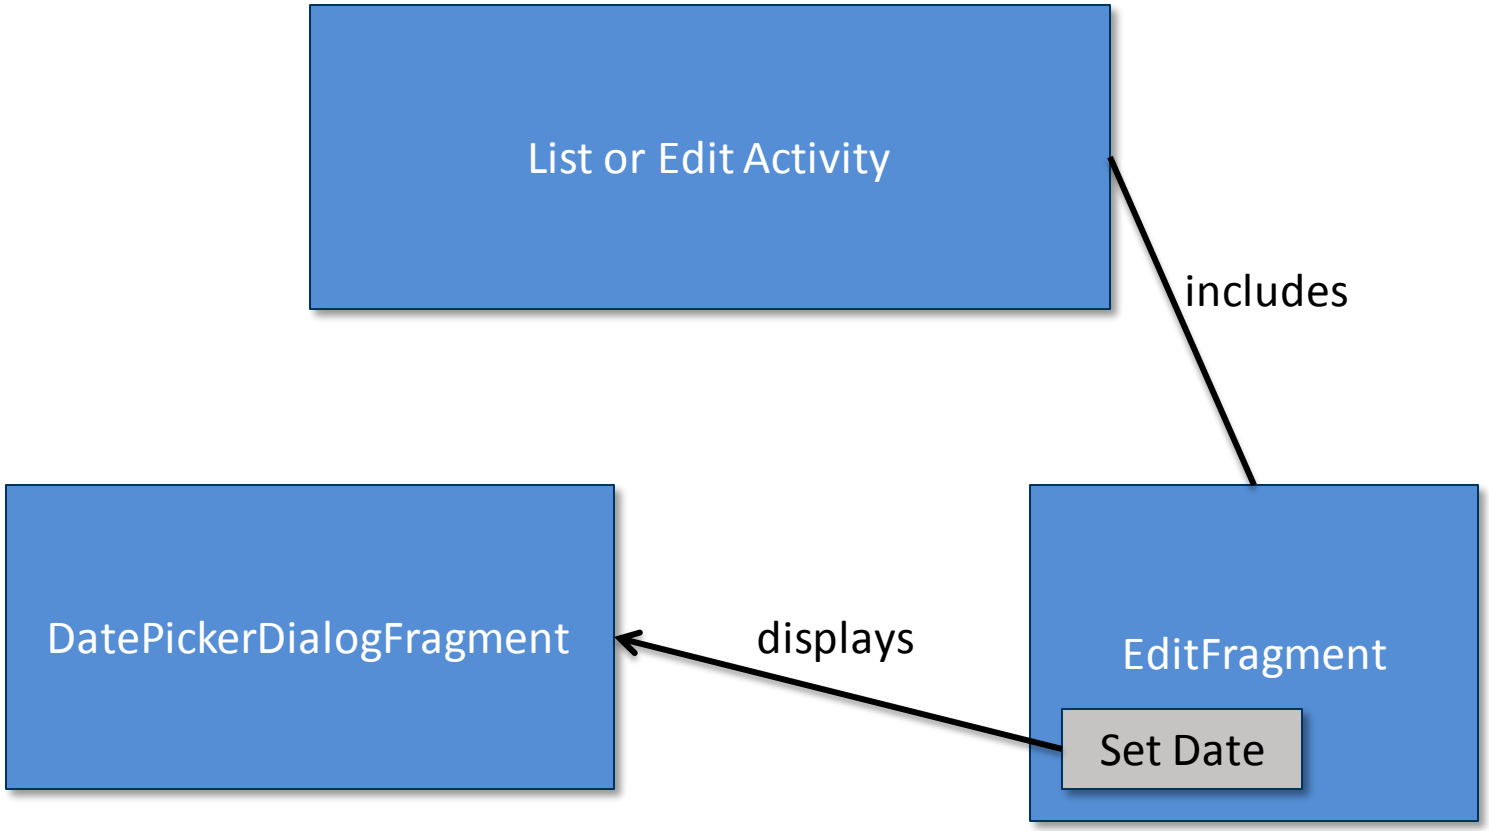
Module 9a
Date and Time Pickers

DatePickerDialog Fragments



- Tricky part – getting data BACK to the EditFragment

DatePickerDialogFragment

WARNING: MOST ONLINE EXAMPLES ARE BAD!!!

- Most assume that the listener is still around
  - If you rotate the display while the dialog is up, listener is no longer valid
- Most assume a fragment/activity only works with a single date

My Approach (1)

Static factory methods to assist setup

- Caller passes “date id” so they can distinguish which date they’re setting
- Caller passes in a fragment that implements a custom listener
  - Listener returns set date and the “date id”
- Caller may pass in an initial date

My Approach

- Factory methods create an arguments object that is reused if fragment is recreated. Tracks:
  - Initial date
  - Id of fragment that implements listener
  - Date id

- When user sets date
  - We look up fragment id, verify it's available, and call listener method

Using DatePickerDialogFragment

```
public class EditFragment extends Fragment
 implements OnDatePickerDialogFragmentDateSetListener
  private static final int BIRTHDAY = 1;

  @Override public void onDateSet(
    int dateId, int y, int m, int d) {
    if (dateId == BIRTHDAY) {
      // UPDATE THE DATA/DISPLAY
  }

...
  DatePickerDialogFragment f =
   DatePickerDialogFragment.create(
        EditFragment.this, BIRTHDAY, date);
  f.show(getFragmentManager(), "date picker");
```
