605.486 – Android Development

Module 8e

Multiple Fragments

Multiple Fragments in Layout (1)

- Define alternative device layouts
  - Examples: landscape, minimum screen sizes…
- Add fields to contain fragments
  - Use fragment manager to locate
  - if fragment != null && fragment.isInLayout()
    - We can use it in the activity
    - May want boolean flag to track if we're in multiple fragment mode

Multiple Fragments in Layout (1)

- Use FragmentManager to show/hide fragments as needed
  - Use transactions to do operations in batches!
- If multiple fragments
  - Do not launch other activities
  - Just set the data!

Note: Other Activities…

- Careful – if you rotate the device from other activities, it will not go into side-by-side mode
  - Just shows landscape view of the current activity
- Pressing back should launch side-by-side if present for previous activity

Note: Other Activities…

- Could override onConfigurationChanged, set some data and finish()
  - Makes assumptions about what is displayed in the other activity
- Generally safest to simply rotate the current view and when they go back they'll see the enhanced view
